Conversion of a TO system from natural gas to LPG | fuel oil | electrical power

Below we have summarised the options for converting a TO system from natural gas to liquid gas (LPG), fuel oil or electrical energy.

If you want to carry out a changeover, an inspection of the existing equipment by our specialist staff is required in advance.

The following solutions are available:

1. Conversion from natural gas to liquid gas (LPG):

- Retrofit or replace the burner, depending on the year of construction.
- Control cabinet and gas control system renewal, depending on the year of construction.
- Gas tank and piping up to the gas control line can be set on-site.

2. Conversion from natural gas to fuel oil:

- Retrofit or replace the burner, depending on the year of construction.
- Control cabinet and gas control system renewal, depending on the year of construction.
- Oil tank and piping up to the gas control line can be set on-site.

3. Conversion to electrical energy source:

This alternative is currently being technically verified by us.

From today's perspective, the changeover options are only possible for a small percentage of the existing systems. There will be solutions for new systems.

Do you have any further questions?

Please feel free to contact us by e-mail or telephone:
